Upfront

Get your Bitcoin yield today.

Bitcoin locked on Mezo earns MUSD every week. Upfront lets the owner sell the next weeks of that income for MUSD now, and get the position back when it has paid.

Live app	**upfront-black.vercel.app**
Code	**github.com/Babytech44/upfront**
Contract	`0x5D62b7E4c0Aa860F47A8Ab8B9410986A1fFd8b17 · Mezo testnet, source verified`

THE PROBLEM

Locked Bitcoin pays a little every week. The owner cannot get any of it sooner.

788.9 BTC
locked in 469 active positions on Mezo mainnet

10,000 MUSD
paid every week to positions that vote for the savings-vault gauge, in each of the last seven weeks

46,361 MUSD
already earned from that gauge and still sitting unclaimed

- A locked position cannot be unlocked early, and Mezo does not accept it as collateral for MUSD.
- Its income arrives once a week and has to be claimed by hand.
- An owner who needs MUSD this week has one choice today: wait.

Figures read from Mezo mainnet on 12 Nov 2026. Lock rules from Mezo's Earn documentation.

IN PLAIN TERMS

It works like rent paid in advance.

A landlord's house earns rent every month, but the landlord needs money today.

Someone pays the next three months of rent now, at a small discount, and collects the rent from the tenant until they have received what was agreed.

The landlord never sells the house and owes nothing.

IN THE STORY	ON MEZO
The house	Your locked Bitcoin. It stays locked and is never sold.
The rent	The MUSD that Mezo pays the position every week.
The landlord	The seller, who gets MUSD today.
The person who pays in advance	The buyer, who receives the weekly MUSD until paid.
The agent holding the papers	The Upfront contract. It hands the position back once the buyer has been paid.

One difference: this rent is not fixed. Mezo sets it each week. If it falls, the buyer waits longer, and the seller never owes a top-up.

THE PRODUCT

Sell the income. Keep the Bitcoin.

The owner chooses how much MUSD they want today. A buyer pays it, then receives the position's weekly MUSD until an agreed total is reached. Then the position goes back to its owner.

Seller: 1 BTC locked at full boost

Position earns	**about 112 MUSD a week**
Asks for	**1,200 MUSD today**
Receives now, after the 1% fee	**1,188 MUSD**
Gets the position back in	**about 12 weeks**

Buyer: holds MUSD

Pays	**1,200 MUSD**
Receives from the position	**1,349 MUSD**
Gain	**149 MUSD, 12.4%**
Paid by	**Mezo's weekly payout**

No loan · No interest · No liquidation · No price oracle · The Bitcoin never leaves its lock

Example at the mainnet rate on 12 Nov 2026. The weekly payout is set by Mezo and can change.

HOW IT WORKS

One contract, four actions.

1

Offer

The seller sets the MUSD wanted today and the total the buyer will receive. The position moves into the contract. MUSD it had already earned goes to the seller.

2

Buy

A buyer pays. The seller receives the MUSD at once, less 1%. The contract votes the position for Mezo's savings-vault gauge.

3

Collect

After each Thursday reset, anyone can press Collect. The contract claims the week's MUSD and sends it to the buyer.

4

Back to the seller

When the buyer has received the total, the position returns. The seller can also pay the rest early, or cancel an offer nobody bought.

Why an amount, not a number of weeks

A seller could cut the position's boost after selling "twelve weeks". Selling an amount removes the reason: a lower payout only delays the seller's own position.

What protects each side

Every sale has a time limit set by the seller. At the limit the position returns even if the buyer is not fully paid. No admin keys, no upgrades, fee fixed in code.

MEZO INTEGRATION

Built only from Mezo's own contracts.

MEZO PIECE	WHAT UPFRONT DOES WITH IT
veBTC the locked-Bitcoin position	Holds the real position for the length of the sale. Accepts permanent locks; refuses grant-backed and managed ones.
Voter	Votes the position for the savings-vault gauge at purchase, and refreshes its weight so the buyer sees the true figure.
Gauge fee contract	Claims the position's weekly MUSD. Mezo pays whoever holds the position, so the contract can pass it on.
MUSD	The only currency: the price, the payout, the fee and the early-settlement payment are all MUSD.

No mock tokens

Every address is Mezo's deployment. The same code runs against mainnet state in the tests.

New demand for MUSD

Buyers need MUSD to take part, and are repaid in MUSD by Mezo's own payout.

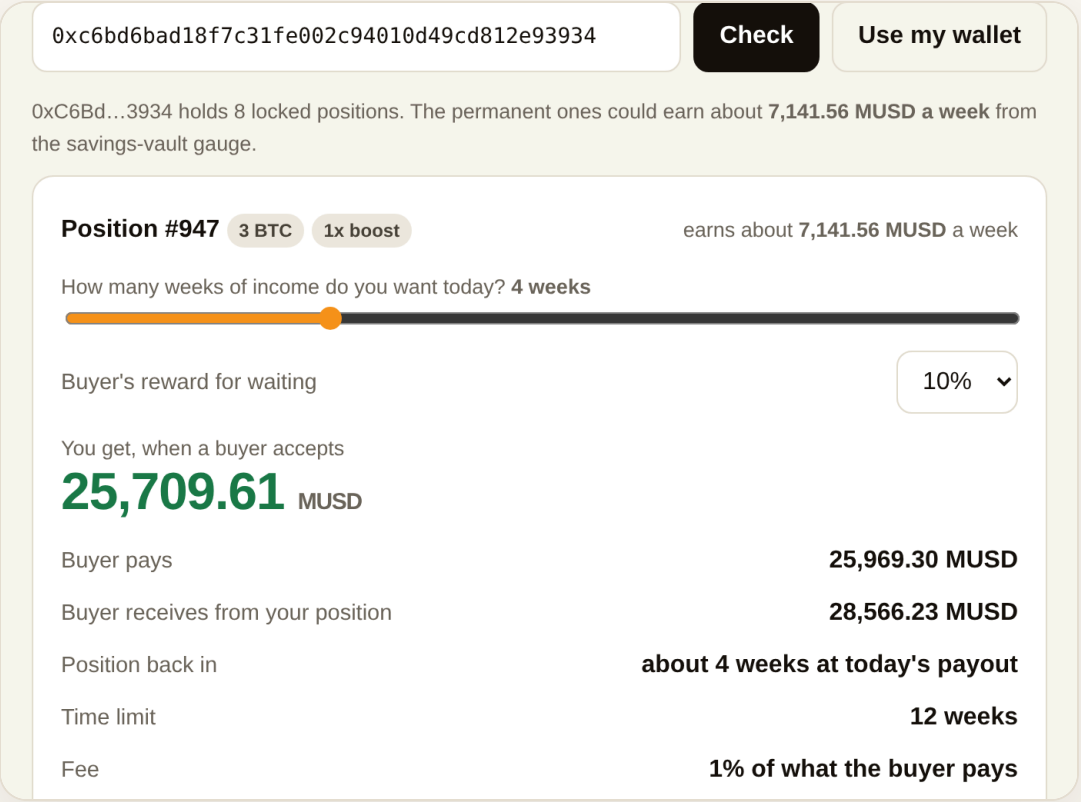

Extends Mezo Earn

It adds a use for locked Bitcoin that the Mezo app does not offer, and adds no new token.

Addresses for testnet and mainnet are listed in the README.

THE APP

Three screens, plain words, no wallet needed to look.

- **Paste any wallet address** to see what its locked Bitcoin could get today. Nothing to connect.
- **One number on the sell screen:** "You get 25,709 MUSD when a buyer accepts."
- **Buyers see the risk before paying:** a slider shows how long repayment takes if Mezo's payout falls.
- **Every sale is public:** paid so far, ready to collect, next payout date.
- **Errors in plain language,** with a link to each transaction.

upfront-black.vercel.app
Static page, no server. It reads Mezo's public RPC directly.

Screenshot of the live app on Mezo testnet, 13 Nov 2026

PROOF

Real sales are running on Mezo testnet.

Three offers on the deployed contract

Contract deployed	`0x66b6b010…76dc4e`
Offer #0: seller asks 30 MUSD today for 33	`0x822a79af…1d2ed5`
Offer #0: buyer pays 30 MUSD	`0x2cd45a92…ad194f`
Offer #1: sold in the live app with MetaMask	`0x7b2891a1…462bbb`
Offer #2: made by a first outside tester	`0xe2af0eba…41dfed`
First payout (offer #0)	**Thu 19 Nov, about 71 MUSD expected**

Mezo pays once a week, so the first payout falls after the submission date. Full hashes are in the README.

Source verified on the Mezo explorer

The deployed bytecode matches the repository build.

19 contract tests on forked Mezo state

18 on testnet, 1 on mainnet. On mainnet position #5651 the buyer receives 534 MUSD after the first weekly reset.

Browser test of every button

Offer, buy, collect in part and in full, settle early and cancel, driven through the real page on a forked chain.

MARKET AND FEE

A small market today, stated plainly.

Who uses it

Sellers: people with locked Bitcoin who need MUSD now and do not want a loan.
Buyers: MUSD holders who want a fixed MUSD return over a few weeks, paid by Mezo's own payout.

Fee

1% of the price, taken from the seller when a buyer pays. Fixed in the contract. Nothing is charged to look, to offer, to cancel or to collect.

Mainnet today

Paid to this gauge's voters	**10,000 MUSD a week**
Share of the two largest positions	**about 7,050 MUSD a week**
The other 405 positions	**2,944 MUSD a week**
If all 405 sold a full year	**about 153,000 MUSD**
Fee on that	**about 1,500 MUSD a year**

Upfront is a building block, not yet a business. Its volume grows with what Mezo pays to locked Bitcoin, and with each further gauge or token it supports.

RISKS AND LIMITS

What a user should know before using it.

The buyer carries the payout risk

If Mezo lowers the weekly payout, or more Bitcoin votes for the same gauge, the buyer is repaid more slowly and may not be repaid in full by the time limit. We have not confirmed who funds the 10,000 MUSD a week or for how long.

Not audited

The contract is small and tested against real Mezo state, but no outside party has reviewed it. It is on testnet only.

Permanent locks only

Timed locks lose voting weight over time, which would cut the buyer's income. They are refused in this version. The app offers to make a timed lock permanent.

One outside tester so far

Offers #0 and #1 were between the builder's own wallets. On 13 Nov a friend of the builder made offer #2 in the live app with their own wallet. What confused them, and what changed, is in the README. Testers from the Mezo community come next.

The seller's risk is limited to time: the Bitcoin stays locked in Mezo's contract throughout, and the position returns at full payment, at early settlement, or at the time limit.

WHAT COMES NEXT

Three milestones.

1

November 2026

Collect the first payout on 19 Nov and publish the transaction. Get five people from the Mezo community to complete a sale on testnet and record what confused them.

2

December to January

Independent review of the contract. Then mainnet, with a cap on the size of each sale while it is new.

3

First quarter 2027

Accept timed locks with a fair discount, pass MEZO rewards to the buyer as well as MUSD, and let one buyer fund several offers in a single step.
